
Star Mass (float)
initial Positions
initial velocities
Planet Masses (np. Array)
Planet Positions (np.Array)
Planet velocities (np. Array)
For i in "frames":
For j in "Planet":
Update "Planet Positons[+1]"
Update "Planet velocities[+1]"
We Update Arrays with Euler-Cromer:
- Use initial values to find current akseleration of Planet "g".
- Use "g" to find "gx" "gy".
- Use "gx" and "gy" to find "vx" and "vy" in next "frame".
- Use "vx" and "vy" to find "x" and "y" in the next "frame".
- Repeat for every "frame".
Calculate: Potential energies
kinetic energies
total energies
(check if energy is conserved)
